TH MECHANISM

Manual related to the VM-E220A/E520A/

This model uses a TH MECHANISM.
Refer to the following manuals for the
TH MECHANISM.

CAUTION (COLOR LCD EVF)

LCD display; the liquid crystal display (LCD) panel is made by highly precise technology. More than 99.99% of its picture elements (pixels) are effective, but some (less than 0.01%) may appear as colored bright dots. This does not indicate a fault as the LCD panel stretches the limits of current technology.

CAUTION (CRT EVF)

Be careful of the section painted in white on the electronic viewfinder circuit board as it generates a high voltage.

PRODUCT SAFETY NOTICE

Many electrical and mechanical parts have special safety-related characteristics. These are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for a higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this Service Manual. Electrical components having such features are identified by marking with a Δ on the schematics and the parts list in this Service Manual. The use of a substitute replacement component which does not have the same safety characteristics as the HITACHI recommended replacement one, shown in the parts list in this Service Manual, may create shock, fire, or other hazards. Product safety is continuously under review and new instructions are issued from time to time. For the latest information, always consult the current HITACHI Service Manual. A subscription to, or additional copies for, HITACHI Service Manual may be obtained at a nominal charge from HITACHI SALES CORPORATION.

X-RAY RADIATION

The primary source of X-ray radiation in this viewfinder is the picture tube. The tube used in this viewfinder is specially constructed to limit X-ray radiation emission. For continued X-ray radiation protection, the replacement tube must be the same type as the original, Hitachi approved one.

How to discriminate the "TYPE" identifications in the manual

The parts and circuits are identified by "TYPE" in this manual to discriminate the differences between models. The TYPE numbers are the same as the model numbers. The table below shows how to read the TYPE identifications.

TYPE identification	Model name
TYPE 220 →	VM-E220A
TYPE 520 →	VM-E520A
TYPE 521 →	VM-E521A
TYPE 620 →	VM-H620A

LEADLESS (CHIP) COMPONENT IDENTIFICATION

1. Leadless Transistor

The part name of a leadless transistor is indicated by a code on its surface, using one letter, one letter and one numeral, two letters, two letters and one numeral, two numerals, two numerals and one letter, three letters, or four letters.

Note: There are transistors with the same code but different part names, or with the same part name but different codes. Refer to the parts lists to finally identify a transistor.

MAINTENANCE/INSPECTION PROCEDURE

1. Required Maintenance

The recording density of a VCR is much higher than that of an audio tape recorder. VCR components must be very precise to ensure compatible with other VCRs. If any of these components are worn or dirty, the symptoms will be the same as if the part is defective. To ensure a good picture, periodic inspection and maintenance, including replacement of worn-out parts and lubrications, is necessary.

2. Scheduled Maintenance

Schedules for maintenance and inspection are not fixed because they vary greatly according to the way in which the customer uses the VCR, and the environment in which the VCR is used. But, in general home use, a good picture will be maintained if the inspection and maintenance is done every 500 hours. Table 1 shows the relation between time used per day and inspection period.

Table 1

Average hours used per day	When inspection is necessary		
	About 6 months	About 9 months	About 18 months
One hour			
Two hours			
Three hours			

3. Check before starting Repairs

The faults occurring in the playback picture as shown in Table 2 can be remedied by cleaning and oiling. Check the need for lubrication and the conditions of cleanliness in the unit. Check with the customer to find out how often the unit is used. If from that you determine that the unit is ready for inspection and maintenance, check the parts shown in Table 2.

Table 2

Phenomenon	Inspection Location
Poor S/N, no color	Dirt on video head or worn video head
Tape does not run or tape is slack	Dirt on pressure roller, cylinder or in tape transport system
Vertical jitter	Dirt on video head or in tape transport system
Low volume or sound distorted	Dirt on video head or worn video head

4. Tools Needed for Inspection and Maintenance

- (1) Head cleaning kit
- (2) VCR oil and grease (Table 3)
- (3) Alcohol
- (4) Gauze
- (5) Cleaning tape [Maxell 8M-CL MCA (dry type)]

Table 3 Locations for Greasing and Oiling

Name	Oil or Greasing Location
Sonic Slidas Oil (#1600)	Oil low-speed rotating sections
Froil (G31-SA)	Lubricate metal or molded section under light load
Molicoat (PG-641)	Lubricate metal or molded sections under light load
Lock paint	Fix adjustment screws and nuts.

5. Maintenance Procedures

5-1 Cleaning

(1) Cleaning video head

First use a cleaning tape. Be sure to use the specified cleaning tape and read its instruction sheet carefully before using it. If dirt on head is too stubborn to remove by tape, use the cleaning kit. Moisten the cleaning stick with cleaning fluid at the point indicated. Touch the stick to the head tip and gently turn the head (rotating cylinder) to the right and left. (Do not move the stick vertically and make sure that only the chamois leather on the stick comes into contact with the head. Otherwise, the head may be damaged.) Thoroughly dry the head. Then test run a tape. If cleaning fluid remains on the video head, the tape may be damaged when it comes into contact with the head surface.

(2) Cleaning the tape transport system and drive system, etc.

Wipe with gauze moistened with alcohol.

Notes: 1) The tape transport system is the system which comes into contact with the running tape. The drive system consists of those parts which run the tape.

2) Make sure that during cleaning you do not touch the tape transport system with the tip of a screwdriver and that no force is applied to the system that could deform it.

5-2 Lubrication

- (1) Guide lines for lubricating with oil
Use the oiler to apply one or two drop of Sonic Slidas oil. Make sure not to use too mach oil because it may spill over or leak out coming into contact with rotating parts and causing slippage or other problems. If too much oil is applied, wipe clean with alchohol.
- (2) Periodic oil lubrication
Lubricate the specified locations only when replacing components. Refer to the exploded views for the lubricating locations.

5-3 Greasing

- (1) Greasing guidelines
Apply grease Froil or Molicoat, with a stick or brush. DO not use excess grease. It may come into contact with the tape transport or drive system. Wipe any excess and clean with gauze moistend with alchohol.
- (2) Periodic greasing
Grease the specified locations only when replacing components. Refer to the exploded views for the greasing locations.

Fig. 4-4

2. CHANGE OF "TH MECHANISM"

This describes only the differences from the "TH MECHANISM" manual issued previously.

1. DISASSEMBLY

2-1. Cassette holder (Fig. 2-1)

- 1) Move the eject lever in the direction of arrow (A) and set the unit to the eject state.

Caution when reinstalling

- Reinstall the cassette holder so that section (B) of the eject lock slider is inserted into section (C) of the eject lock arm.

2-12. Chassis plate, Take-up reel disk (Fig. 2-13)

- 1) Remove screw (1) holding the chassis plate.
- 2) Remove the chassis plate from the chassis.
- 3) Pull out the take-up reel disk from the take-up reel disk shaft.

Caution when reinstalling

- When reinstalling the chassis plate, make sure the flange covers over the edges of the tension band.

2-13. Eject lock drive arm (Fig. 2-13)

- 1) Remove the eject lock drive arm from the chassis plate.

Caution when reinstalling
Reinstall the eject lock drive arm so that pin (B) of the eject lock arm is inserted into hole (A) in the eject lock drive arm.

DELETED

3-2. Loading Gears and Loading Ring (Figs. 3-2, 3-3)

Caution

- Be careful that the phase of the mechanism state switch which was matched in item 3-1 does not drift.

Procedure of phase matching in assembly

- 1) Align the markings of the loading ring and gears as shown in Fig. 3-2.

Caution: When reinstalling the pressure roller cam gear, set the eject lock drive arm to the position shown in Fig. 3-3 and check that pin (j) is inserted into groove (J) in the back of the pressure roller cam gear.

Advice: If it is difficult to see marking (D) on the lower loading ring, match the phase by the following procedure.

- ① Set the upper and lower loading rings to the state shown in Fig. 3-2. (Watch the guide roller fixing section.)
- ② Move the upper and lower loading rings so that holes (H) overlap each other.
- ③ If holes (H) overlap each other, the phase of the loading ring is correct.
- ④ If holes (K) overlap each other, the phase of the loading relay gear (4) is correct.

6. MODIFICATION TO ATF-R JIG (Fig. 6-1)

Caution: The ATF-R jig must be modified for the following adjustments.
After completing these, be sure to reverse the modification.
• 3-3. Supply/Take-up Guide Roller Height Adjustment
• 4. ADJUSTMENT AFTER REPLACING THE CYLINDER

Procedure

- 1) Short terminal (A) of the resistor on the ATF-R jig and pin 1 (5V) of the connector.

Note: This modification makes SW2 on the ATF-R jig a PCM area observation switch.

Caution: Use a shorting clip, etc. to short the parts; this can be removed easily after adjustment is completed.
A modification is also necessary in the same way when the ATF jig is used.

Cautions when using schematic diagrams

Caution for safety

The parts marked Δ are critical for safety. Be sure to use the specified parts to ensure safety when replacing them.

1. Values in schematic diagrams

The values, dielectric strength (power capacitance) and tolerances of the resistors (excluding variable resistors) and capacitors are indicated in the schematic diagrams using abbreviations.

[Resistors]

Item	Indication
Value	No indication Ω K k Ω M M Ω
Tolerance	No indication \pm 5% (All tolerances other than \pm 5% are indicated in the schematic diagrams)
Power capacitance	No indication 1/8W (1/16W for leadless resistors without indication) All capacitances other than the above are indicated in the schematic diagrams.

[Capacitors]

Item	Indication
Value	No indication μ F P pF
Dielectric strength	No indication 50V (All dielectric strengths other than 50V are indicated in the schematic diagrams.)

[Coils]

Item	Indication
Value	μ μ H m mH

2. Markings in schematic diagrams

- Parts marked "■" with circuit numbers in the schematic diagrams are discrete parts.
- Parts marked "●" with circuit numbers in the schematic diagrams are leadless parts.

Cautions when using circuit board diagrams

1. Identifications of sides A/B in circuit board diagrams

- Board having a pattern on one side and parts on both sides.

Side A: Shows discrete parts, viewed from the pattern side.

Side B: Shows leadless parts, viewed from the pattern side.

- Board having patterns on both sides and parts on both sides.

Side A: Shows parts and patterns which can be seen when the case is opened.

Side B: Shows parts and the pattern on the back of side A.

2. Table for indexing locations of parts

This table shows locations of each part on the circuit board diagrams. The locations are indicated using the guide scales on the external lines of diagrams.

- In case of one-layer board

- In case of side A/B indication board

A: Shows side A

Setting the Date and Time

Take the time to set the date and time now. The date and time can be recorded on your tapes to act as a handy reference when viewing them later. Use the following procedure to set up the display for the current date and time.

Note: Be sure to insert the clock battery below setting the date and time. Although the date and time can be set without the clock battery inserted, they will disappear when the battery providing power to the camcorder is removed.

Make sure that the current time is displayed correctly before you start filming.

1. Load the battery ("Loading the Batteries: Camcorder batteries" p.15). Press the red button on the CAM/OFF/VIDEO switch as you slide it to CAM.

2. Press the DATE/TITLE button and look into the viewfinder. The date and time should appear in the lower right with the "1" flashing.

3. Pressing the F.F button gives you higher numbers while the REW button gives you lower numbers. Select the right month and press STOP button. Use the F.F, REW and STOP buttons to select the proper day, year, hour, minute, and AM or PM.

4. After setting the AM/PM, press the DATE/TITLE button. The display changes and the internal clock starts.

Note: After the date and time are set, "Q AUTO" appears and the camcorder enters the automatic date recording mode. See "Date Recording" on page 33.

Correcting the Date and Time

2. Hold down the red button on the CAM/OFF/VIDEO switch while sliding the switch to VIDEO.

Using Still

To view a still picture during playback press the Start/Stop button. Press the Start/Stop button again to resume playback. If you leave the camcorder in play/pause mode for more than 5 minutes the camcorder automatically stops the cassette to prevent damage to the tape.

Note: When you engage play/pause mode the still picture will have some interference or noise. This is normal.

Using Forward and Reverse Search

When looking for a particular point in your videotape use the F.F button and REW button to find the spot quickly.

- Press F.F button during playback to play the tape forward at approximately 9 times normal speed. Press PLAY button to return to normal playback.

- Press REW button during playback to play the tape backwards at approximately 7 times normal speed. Press PLAY button to return to normal playback.

Note: When you engage F.F button or REW button the picture will have some interference or noise. This is normal during search mode.

To Play Back a Recording at Double the Normal Speed

Activate the video playback mode by moving the CAM/OFF/VIDEO switch to "VIDEO". Press the PLAY button located on either the remote control or the camcorder one time and the video will appear in the viewfinder or a connected monitor. While the tape is playing press the PLAY button again and the camcorder will now play both audio and video at double speed.

To restore normal playback, press the PLAY button on either the remote control or the camcorder.

Note: The indication showing double speed playback does not appear.

Note: When double speed playback is activated, both the picture and sound are played back at twice the normal speed. This will cause noise lines to appear on the picture and the sound to become wobbled. (With some tapes the width of the noise band may vary or noise may flow.)

Note: With some TVs, the synchronization may unlock and the picture may fluctuate or the picture may become black-and-white.

Note: Be sure that the date and time are set.

1. Attach a power source and slide the CAM/OFF/VIDEO switch to VIDEO.
2. Press the DATE/TITLE button (the DISPLAY button on the remote control) to display "SEARCH" in the viewfinder.

Note: If you have ejected the cassette, this function will not operate with that cassette. (When a cassette is inserted and the recording is started, the position is identified as the recording start position on that day.)

Note: If the date/time battery is not inserted, the date search function does not operate when the battery providing the power to the camcorder is removed.

Note: When the cassette was recorded by another camcorder, the date search function does not operate.

Note: The date search function is released when you press the STOP button during date search mode.

Note: If the recorded time is less than 30 seconds, the date search function may not operate normally.

4. Press the REW button and the tape stops at approximately where you reset the linear time counter. This feature works in F.F. as well.

Using the Display Button

Pressing the DISPLAY button on the remote control allows you to switch the displays in the viewfinder. When the camcorder is turned on, the linear time counter appears.

- Pressing the DISPLAY button once displays the linear time counter with the memory feature.

- When a recorded tape is in the camcorder during the VIDEO mode, "SEARCH" appears in the viewfinder. (Refer to "Date Search" on page 40).

- Pressing the DISPLAY button a second time returns to the linear time counter.

Note: The linear time counter with the memory feature in the viewfinder can also be displayed on the connected television.

Simple Programmable Edit (Edit remote control is optional accessory)

Simple programmable edit allows you to program your camcorder to select the scenes you want to copy from a pre-recorded tape. Use the edit remote control (optional) to easily copy scenes from a recorded tape in the camcorder (playback machine) onto a blank tape in a table-top VCR which handles infrared remote signals (recording machine).

Note: If you make a mistake during programming, start again from the beginning or press the COUNTER RESET button to return to the previous steps one by one and enter the correct program data.

Note: After the simple programmable edit is finished, the programmed data is erased. If you want to continue editing other segments, repeat steps 5—12.

Note: Most VCRs (recording machine) may be released from the record pause mode if it continues for more than five minutes.

Note: The dubbing start and end positions may slightly drift from the specified positions when certain VCRs are used.

To End Programmable Simple Edit

Press the PROGRAM button to remove the program display from the viewfinder. Then press the stop button on the recording VCR to set it to the stop mode.

Note: If the CAM/OFF/VIDEO switch of the camcorder is set to OFF or CAM when the recording VCR is in the record pause mode, the VCR enters the record mode.

General Maintenance

Cleaning the camcorder Heads

Dirt can accumulate on the video heads on the camcorder causing the playback picture to become blurred or appear as if video information is lost. This often means that the video heads are dirty. Use a video head cleaner such as a dry type head cleaning tape to clean the heads. If after cleaning the heads the picture does not clear up consult your nearest dealer or VCR service center for professional head cleaning.

Cleaning the Lens and Picture Tube of the Electronic Viewfinder

The lens of the electronic viewfinder can be user-cleaned if dust, dirt, or other foreign matter adheres to it.

1. Rotate and remove eye cup.
2. Clean the picture tube face and lens.
To prevent scratching, use a soft, non abrasive cloth, swab or lens cleaning paper.

Periodic Maintenance

A precision electromechanical device, the Hitachi VM-H620A/H710A requires maintenance after a period of normal use. We expect that no maintenance other than head cleaning will be required during the period of warranty unless the camcorder is used either heavily or seldom. Defective parts are covered by the warranty. Normal maintenance is the responsibility of the owner. Consult your dealer or local VCR service center for recommendations regarding normal maintenance based on your use patterns, location, and the age of the camcorder.

UNLOADING METHOD

The method to set the unassembled mechanism to the unloading state is described here.

1. When the loading motor is normal (Fig. 1)

<Procedure>

- 1) Set the power supply to 3-5V DC. (Do not apply more than 5V as this could result in a secondary defect.)
- 2) Connect the red wire to the positive terminal and brown wire to the negative terminal to activate unloading.

Fig. 1

2. When the loading motor is faulty (Fig. 2)

<Procedure>

- 1) Remove the loading motor.
- 2) Turn the cam gear shown in Fig. 2 with your hand in the direction of arrow (A).

Fig. 2

DISASSEMBLY METHOD

Refer to the following "Parts hierarchy chart" first when replacing defective parts.
This chart shows the parts removal procedure as the hierarchy in which parts should be replaced.

[How to use the parts hierarchy chart]

- 1) Search for the part to be replaced in chart.
- 2) Check the part in the rank above the part to be replaced and the start dismantling.
- 3) Replace the defective part and install it by the reverse order to that shown in the hierarchy chart.
- 4) In the following text, remove the part in the order of letters (A,B,C...) shown in the illustrations.

MECHANISM ADJUSTMENT

1. MAJOR MECHANICAL COMPONENTS

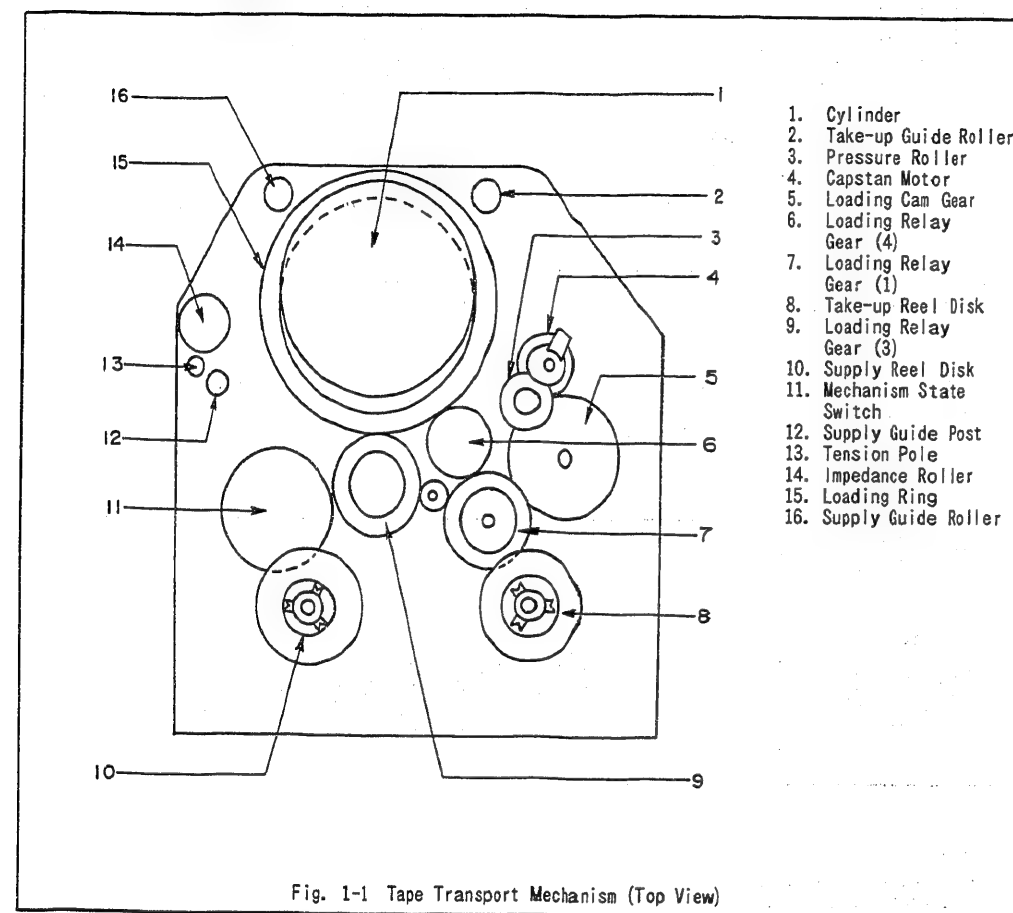

Fig. 1-1 Tape Transport Mechanism (Top View)

2. BEFORE STARTING ADJUSTMENT

- 1) Be sure to set the camera/recorder to the unloading/stop mode when dismantling the tape transport block.
- 2) Do not re-use washers once they have been removed.
- 3) Dismantle the mechanism, referring to "DISASSEMBLY" so the mechanism adjustment can be done.
- 4) With this camera/recorder, mechanical adjustments (tape transport system check/adjustment) can be done with the unassembled VTR block (without connecting the camera block).
- 5) To set the camera/recorder to the playback mode without loading a cassette, shut off the light striking the end LEDs in the chassis and press the playback button. (Shut off the light striking the end LEDs in the eject state.)

3. TAPE TRANSPORT SYSTEM CHECK/ADJUSTMENT

The tape transport system is a generic term for the path from the supply reel disk to the take-up reel disk via the cylinder. The tape transport components, especially the components which come into direct contact with the tape, should be kept clean without damage, dust or oil, etc. adhering to the contact surfaces. The tape transport system is adjusted before shipment from the factory, so perform adjustments only when components of the transport system are replaced or adjustments of the transport system have drifted.

3-1. Tension Pole Position/Tension Torque Adjustments (Fig. 3-1)

Caution

- Be sure to perform these adjustments after reinstalling the tension arm, tension band and tension spring.

• Cassette torque meter (SRK-8T-112/212)	• Load a cassette torque meter	• Set to the playback mode.	• Tension spring
Adjustment procedure ◆ Tension pole position adjustment (Fig. 3-1) 1) Hook the tension spring to position (B) of the tension spring holder. 2) Loosen screw (D) holding tension band holder (E). 3) Adjust the position of tension band holder (E) so the relationship between the hole in the tension arm and guide roller rail is as shown in Fig. 3-1. 4) Tighten screw (D). 5) Repeat playback and stop several times and check that the specification in step 3) is satisfied. If it is not satisfied, re-adjust the tension pole position. ◆ Tension torque adjustment (Fig. 3-1) 1) Hook the tension spring to position (B) of the spring holder. 2) Set the tension torque on the supply side to 4.5 - 5.5 g-cm. If it is more than 5.6 g-cm: Move the tension spring to position (A) of the spring holder. If it is less than 4.4 g-cm: Move the tension spring to position (C) of the spring holder.

4. ADJUSTMENT AFTER REPLACING THE CYLINDER (Figs. 4-1, 4-2)

When the cylinder is replaced, the height relative to the guide roller drifts, therefore the tape transport system and servo circuit should be adjusted. Check and adjust in the following order.

Test equipment/jigs	Test equipment/jigs connection points	State of VCR	Adjustment point
• Alignment tape • Oscilloscope • ATF-R jig • Special driver	• Test Plug on Main board • TP1(SW25/30) on ATF-R jig • TP2(GND) on ATF-R jig • TP3(FM OUT) on ATF-R jig	• Connect the ATF-R jig to test plug. • ATF-R jig (SW1: OFF, SW3: ON, RT1: mechanical center)	• Top of guide rollers

● Adjustment procedure

Caution: Before performing this adjustment, refer to Fig. 6-1 and modify the ATF-R jig.

- 1) Load an alignment tape that has been completely rewound. Press the PLAY button and hold it, then set the POWER switch to the VIDEO position.
 - 2) Connect an oscilloscope to TP3 on the ATF-R jig.
 - 3) Synchronise the oscilloscope with TP1(SW25/30) on the ATF-R jig.
 - 4) Set the oscilloscope to (+) slope.
 - 5) Press SW2 on the ATF-R jig and hold it, then perform the following steps.
 - 6) Adjust the voltage level control of the oscilloscope so that portion (A) of the waveform is set to 4 graduations.
 - 7) Set SW1 on the ATF-R jig to ON.
 - 8) Turn RT1 on the ATF-R jig counterclockwise so that portion (A) of the waveform is set to 3 graduations.
 - 9) Adjust the height of the supply guide roller so the minimum amplitude of the waveform is set to NTSC: 2.3 ± 0.3 / PAL: 2.5 ± 0.3 graduations. (See Fig. 4-1)
 - 10) If this cannot be confirmed, adjust the height of the supply guide roller, referring to "3-3. Supply/Take-up Guide Roller Height Adjustment".
 - 11) Set the oscilloscope to (-) slope.
 - 12) Turn RT1 on the ATF-R jig so that portion (B) of the waveform is set to 3 graduations.
 - 13) Check that the minimum amplitude of the waveform is set to NTSC: 2.3 ± 0.3 / PAL: 2.5 ± 0.3 graduations. (See Fig. 4-2)
If this cannot be confirmed, adjust the height of the take-up guide roller, referring to "3-3. Supply/Take-up Guide Roller Height Adjustment".
 - 14) Perform the following electrical adjustments.
• Head switching point adjustment
• Record luminance/chroma level adjustment
- Caution: After adjustment is complete, be sure to reverse the modification to ATF-R jig.

5. CHECKING THE TORQUE

There are two types of cassette torque meter. Choose the applicable one for the measurement to be performed.

Item	VCR mode	Measured reel disk	Torque value	Torque cassette used
Take-up torque	Playback	Take-up	7-13 g-cm	SRK-8T-212 SRK-8T-232
Rewind torque	Reverse search	Supply	25-37 g-cm	SRK-8T-232
Take-up brake torque	Reverse search to stop	Take-up	10 g-cm or more	SRK-8T-212 SRK-8T-232
Slack removal torque	Unloading	Supply	25-37 g-cm	SRK-8T-232

6. MODIFICATION TO ATF-R JIG (Fig. 6-1)

Caution: The ATF-R jig must be modified for the following adjustments.

- After completing these, be sure to reverse the modification.
- 3-3. Supply/Take-up Guide Roller Height Adjustment
 - 4. ADJUSTMENT AFTER REPLACING THE CYLINDER

● Procedure

- 1) Short terminal (A) of the resistor and TP2 (GND) on the ATF-R jig.

Note: This modification makes SW2 on the ATF-R jig a PCM area observation switch.

Caution: Use a shorting clip, etc. to short the parts; this can be removed easily after adjustment is completed.
A modification is also necessary in the same way when the ATF jig is used.

CHAPTER 3

MAINTENANCE/INSPECTION PROCEDURE

1. Required Maintenance

The recording density of a VCR is much higher than that of an audio tape recorder. VCR components must be very precise to ensure compatible with other VCRs. If any of these components are worn or dirty, the symptoms will be the same as if the part is defective. To ensure a good picture, periodic inspection and maintenance, including replacement of worn-out parts and lubrications, is necessary.

2. Scheduled Maintenance

Schedules for maintenance and inspection are not fixed because they vary greatly according to the way in which the customer uses the VCR, and the environment in which the VCR is used. But, in general home use, a good picture will be maintained if the inspection and maintenance is done every 500 hours. Table 1 shows the relation between time used per day and inspection period.

Table 1

Average hours used per day	When inspection is necessary		
	About 6 months	About 9 months	About 18 months
One hour			
Two hours			
Three hours			

3. Check before starting Repairs

The faults occurring in the playback picture as shown in Table 2 can be remedied by cleaning and oiling. Check the need for lubrication and the conditions of cleanliness in the unit. Check with the customer to find out how often the unit is used. If from that you determine that the unit is ready for inspection and maintenance, check the parts shown in Table 2.

Table 2

Phenomenon	Inspection Location
Poor S/N, no color	Dirt on video head or worn video head
Tape does not run or tape is slack	Dirt on pressure roller, cylinder or in tape transport system
Vertical jitter	Dirt on video head or in tape transport system
Low volume or sound distorted	Dirt on video head or worn video head

4. Tools Needed for Inspection and Maintenance

- (1) Head cleaning kit
- (2) VCR oil and grease (Table 3)
- (3) Alcohol
- (4) Gauze
- (5) Cleaning tape (Maxell 8M-CL MCA (dry type))

Table 3 Locations for Greasing and Oiling

Name	Oil or Greasing Location
Sonic Slidas Oil (#1600)	Oil low-speed rotating sections
Froil (G31-SA)	Lubricate metal or molded section under light load
Molicoat (PG-641)	Lubricate metal or molded sections under light load
Lock paint	Fix adjustment screws and nuts.

5. Maintenance Procedures

5-1 Cleaning

(1) Cleaning video head

First use a cleaning tape. Be sure to use the specified cleaning tape and read its instruction sheet carefully before using it. If dirt on head is too stubborn to remove by tape, use the cleaning kit. Moisten the cleaning stick with cleaning fluid at the point indicated. Touch the stick to the head tip and gently turn the head (rotating cylinder) to the right and left. (Do not move the stick vertically and make sure that only the chamois leather on the stick comes into contact with the head. Otherwise, the head may be damaged.) Thoroughly dry the head. Then test run a tape. If cleaning fluid remains on the video head, the tape may be damaged when it comes into contact with the head surface.

(2) Cleaning the tape transport system and drive system, etc.

Wipe with gauze moistened with alcohol.

- Notes: 1) The tape transport system is the system which comes into contact with the running tape. The drive system consists of those parts which run the tape.
- 2) Make sure that during cleaning you do not touch the tape transport system with the tip of a screwdriver and that no force is applied to the system that could deform it.

5-2 Lubrication

(1) Guide lines for lubricating with oil

Use the oiler to apply one or two drop of Sonic Slidas oil. Make sure not to use too much oil because it may spill over or leak out coming into contact with rotating parts and causing slippage or other problems. If too much oil is applied, wipe clean with alcohol.

(2) Periodic oil lubrication

Lubricate the specified locations only when replacing components. Refer to the exploded views for the lubricating locations.

5-3 Greasing

(1) Greasing guidelines

Apply grease Froil or Molicoat, with a stick or brush. DO not use excess grease. It may come into contact with the tape transport or drive system. Wipe any excess and clean with gauze moistened with alcohol.

(2) Periodic greasing

Grease the specified locations only when replacing components. Refer to the exploded views for the greasing locations.
